

CipherPoint Software Releases CipherPointSP™ Data Security Solution for SharePoint

Provides transparent encryption for SharePoint, ensuring private and confidential information is protected.

September 1, 2010, Austin, TX: CipherPoint Software, Inc. announced today the immediate availability of a new data security solution for SharePoint. The solution encrypts and controls access to content stored in SharePoint to protect against both external attacks and the insider threat. The solution, CipherPointSP, transparently encrypts content being stored in SharePoint servers.

CipherPointSP allows organizations to secure their sensitive content, and meet various compliance requirements involving regulated and confidential information. Regulations including PCI DSS, GLBA, HIPAA, and data privacy laws enacted in Massachusetts, California, and numerous other states all either require encryption for sensitive information, or provide compelling incentives for organizations to utilize encryption to minimize the impact of security breaches.

Users of SharePoint interested in learning more about the solution should visit www.cipherpointsoftware.com. CipherPointSP software is priced at \$2,000.

Free downloads of a trial version of the software are available at:
